

8 The photograph shows a Tristan albatross.

(Source: © blickwinkel/Alamy Stock Photo)

The Tristan albatross is endemic to a few small islands in the South Atlantic Ocean.

The adult birds nest on these islands and fly long distances in search of food. They feed on fish, octopus and squid.

The Tristan albatross is critically endangered, with 4 500 of these birds left in the wild.

(a) (i) Describe **two** anatomical adaptations of the Tristan albatross that enable it to occupy its niche.

Use the information in the photograph to support your answer.
